Title of project work: SMART ATTENDANCE USING FACE RECOGNITION

This project aims to develop a real-time face recognition system using computer vision and integrate it with a database for efficient data management. The system will utilize advanced image processing techniques to capture, preprocess, and analyze facial features to identify individuals. The database will store relevant information about the recognized individuals, such as their name, contact details, and other relevant data. The system will also incorporate real-time data synchronization to ensure that the database is updated in real-time with any new entries or modifications. The proposed system has potential applications in security systems, access control, attendance tracking, and many other fields that require accurate and efficient identification of individuals.
